<table>
<thead>
<tr>
<th>Title</th>
<th>Abstract</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paralic deposition in the Barents Sea</td>
<td>The overall depositional environment for the De Geerdalen Formation on Hopen consists of interfingered marine and continental sediments in a coastal plain environment. Findings from the study on Hopen are compared to subsurface data from the time-equivalent Snadd Formation. .................................................... 1911</td>
</tr>
<tr>
<td>A probabilistic approach</td>
<td>This paper presents a probabilistic approach to assess subsurface well-to-well correlations that involve the lateral tracing of geologic bodies across well arrays with a constant spacing. With this method, it is possible to create a model with realistic well-to-well correlation patterns. .................................................... 1943</td>
</tr>
<tr>
<td>A unique resource</td>
<td>A detailed description of the black sediments of the proto-Silesian basin is presented. It is prosed that these shales could represent a unique shale-oil and shale-gas resource in an intensely structured basin. .................................................... 1967</td>
</tr>
<tr>
<td>A useful reference study</td>
<td>This study investigates sediment provenance in the Bohai Basin, China, using three-dimensional seismic data. Transport pathways include faulted troughs, incised valleys, and structural transfer zones. Sediments in the study area formed a deltaic belt and proximal fan deltas. .................................................... 1995</td>
</tr>
<tr>
<td>Overlooked exploration opportunities</td>
<td>The influence of rifting on accommodation creation and shallow-marine deposition during the initial stage collapse of salt diapirs is evaluated in this paper. A better understanding of the factors controlling accommodation above collapsing salt diapirs will help reduce exploration risk. .................................................... 2019</td>
</tr>
<tr>
<td>The attributes of fault damage zones</td>
<td>This study identifies the attributes of fault damage zones with particular emphasis on spatial extent, peak fracture density, and spatial heterogeneity of fracture density. The quantification of these attributes can be incorporated in reservoir flow simulation models. .................................................... 2057</td>
</tr>
<tr>
<td>How faults interact</td>
<td>Geometry, displacement, strain, and fault interactions from two generations of faults, Milne Point, Alaska, are analyzed with three-dimensional seismic reflection. Two abutting faults can link kinematically by reactivating a segment of the pre-existing fault and forming a trailing fault. .................................................... 2081</td>
</tr>
<tr>
<td>Sandstone carrier beds</td>
<td>The distribution of permeable sandstones and their contacts with source rocks are a key for petroleum migration and occurrence in lacustrine sediments. Integration of geophysical, geological, and geochemical studies provides an effective way to trace these pathways. .................................................... 2109</td>
</tr>
<tr>
<td>A significant advance in reservoir characterization</td>
<td>Formation water $\delta^{18}O$, $\delta^2H$, and total dissolved solids values can be determined directly from core samples in a bitumen-saturated reservoir by calculating a mixing relationship between selected parameters in formation waters and drilling fluids. This method has significant benefits for the interpretation of oil sands systems. .................................................... 2131</td>
</tr>
<tr>
<td>Using the technique</td>
<td>The technique described in Part 1 was applied to the waters of the McMurray Formation, Alberta. Results suggest that this water is primarily derived from Holocene groundwater recharge, and that the water within the bitumen reservoir is similar to groundwater well samples. .................................................... 2143</td>
</tr>
