Figure 3B. Aeromagnetic map of north-central New Mexico showing cut lines used in this reconstruction, control points 1–9 (see text), unreconstructed aeromagnetic lineaments, line of section (A–A?) for Figure 7, unreconstructed aeromagnetic features (dashed where location is inferred), and the CD-ROM (Magnani et al., 2005b) seismic reflection line near Las Vegas. Note that dashed lines southwest of Las Vegas are cut lines that represent fictitious faults used to approximate the southward plunge-out of the Sangre de Cristo uplift.
