TABLE OF CONTENTS
JANUARY-FEBRUARY 2022

3  Mo isotope records from Lower Cambrian black shales of northern Tarim Basin (China): Implications for the early Cambrian ocean

15  An intracratonic oxygen exhumed by basement-slice imbrication in the Longmenshan Thrust Belt of the Eastern Tibetan Plateau

39  Segmentation of the Wusak Range normal fault system, Nevada (USA): Implications for earthquake rupture and Walker lane dynamics

60  Tectonically conditioned record of continental interior paleoclimate during the Cenomanian-Pliovulcan Episode: The Upper Triassic Las Rastres Formation, Argentina

81  Low-^3He^1Ar^-type granites in SW China: Evidence for the interaction between the subducted Paleotethys slab and the Emeishan mantle plume

113  Origin and age of the Shenzan tectonic mélangé in the Jianyang-Shaoxing-Pingxiang Fault and late Paleozoic juxtaposition of the Yangtze Block and the West Cathaysia terrane, South China

130  Ancestral trans-North American Bell River system recorded in late Oligocene to early Miocene sediments in the Labrador Sea and Canadian Great Plains

145  Subduction initiation of the western Proto-Tethys Ocean: New evidence from the Cambrian intra-oceanic forearc ophiolite melange in the western Kunlun Orogen, western Tibetan Plateau

175  Late Pleistocene-Holocene flood history, flood-sediment provenance and human imprints from the upper Indus River catchment, Ladakh Himalaya

201  Generation of Cretaceous high-silica granite by complementary crystal accumulation and silicic melt extraction in the coastal region of southeastern China

225  Evidence of Carboniferous arc magmatism preserved in the Chixculub impact structure

259  Oxygen isotope (^18O) trends measured from Ordovician conodont apatite using secondary ion mass spectrometry (SIMS): Implications for paleo-thermometry studies

289  New insights into the formation and emplacement of impact melt rocks within the Chixculub impact structure, following the 2016 ODP-IODP Expedition 364

316  Isotopic temporal-evolution of magmatic rocks in the Gangdese belt: Implications for the origin of Miocene post-collisional giant porphyry deposits in southern Tibet

335  Late Neoproterozoic to early Paleozoic paleogeographic position of the Yangtze block and the change of tectonic setting in its northern margin: Evidence from detrital U-Pb ages and HF isotope of sedimentary rocks

355  Transition from a passive to active continental margin setting for the NE Asian continental margin during the Mesozoic: Insights from the sedimentary formations and paleogeography of the eastern Jamusi Massif, NE China

389  Early Cretaceous thick carbonate accumulation in Northern Lhasa (Tibet): eustatic vs. tectonic control?

405  A newly discovered Late Cretaceous metamorphic belt along the active continental margin of the Neo-Tethys ocean

425  Mantle source of tephritic porphyry in the Tarim Large Igneous Province constrained from Mg, Zn, Sr, and Nd isotope systematics: Implications for deep carbon cycling

439  Superposition of Cretaceous and Cenozoic deformation in northern Tibet: A far-field response to the tectonic evolution of the Tethyan orogenic system

453  Mafic-ultramafic intrusion formed by multi-stage evolution of hydrous basaltic melts
A cloudy afternoon and a filtered ray of sunlight illuminating exposures of the Carnian Los Rastros Formation in Argentina. The lower illuminated outcrop rim shows the progradational stacking pattern that extends for over 500 m thick deposits of black, gray, green, and yellow mudstones and yellow limestones of lake center and lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies. The outcrop in the back is formed by the overlying Ischigualasto Formation, which is the lake margin facies to yellow sandstones of delta facies.
