

Each issue of *Geochemical Perspectives* presents a single article with an in-depth view on the past, present and future of a field of geochemistry, seen through the eyes of highly respected members of our community. The articles combine research and history of the field's development and the scientist's opinions about future directions. We welcome personal glimpses into the author's scientific life, how ideas were generated and pitfalls along the way. *Perspectives* articles are intended to appeal to the entire geochemical community, not only to experts. They are not reviews or monographs; they go beyond the current state of the art, providing opinions about future directions and impact in the field.

About the cover

The seafloor during summer in a Danish eutrophic fjord. The benthic animals suffer from oxygen depletion in the bottom water, while the sediment turns black from iron sulfides and is over-grown by mats of colorless sulfur bacteria.
