Carbon is one of the most important elements on our planet. In the oceans and atmosphere, carbon has important consequences for the global climate system. Complex organic molecules led to life on Earth. Carbon-based energy resources remain of critical importance, both in terms of extraction and mitigation of carbon emissions, but also for planning for a future carbon-neutral society.

Throughout 2019, the Year of Carbon, the Geological Society will showcase both academic and applied research focusing on energy, geochemical cycling, climate and materials, among many others. Events throughout the year will involve academia, industry, economists and government bodies, as well as partner geoscience societies and organisations.

Join us!

BECOME A FELLOW

- Be part of 12000 plus Earth Science Community
- Reduced rates for conference and events
- Fellow’s printed monthly magazine delivered to you
- Free online access to one of the Society’s journals
- Up to 50% discounts on books and special publications
- Access to our extensive geological library in person or remotely
- Networking Opportunities
- Route to CHARTERSHIP
